

Stock Maintenance System

The stock maintenance system must take care of sales information of the company and must analyze the potential of the trade. It maintains the number of items that are added or removed. The sales person is allowed to update information and view the database.

- The system provides an interface to the customer where they can fill in orders for the item needed.
- The salesperson is concerned with the issue of items and can use this system.
- Provide a communication platform between the customer and the salesperson.
- The customer makes an order for the required products.
- The items that are stored as stock.
- The system provides purchase details of the product.
- The system retains the records of cost, vendor details, expiry date and quantity.

The stock maintenance system is described sequentially through steps

- The customer logs in to the particular site.
- They fill the customer details.
- They place the orders for their product.
- The vendor logs in and views the customer details and orders
